

ABSTRACT OD THE DISCLOSURE:

To provide a small-sized and lightweight gearshift operating device capable of performing the gearshift operati on in a short time at low power
5 consumption. A guide slit having a plurality of slits 41 parallel with the
shift fork shafts and a plurality of slant slits 42 concentrated to the neutral
point 43 from them is installed, and the follower 33 is operated along the
guide slit, thus the number of times of starting and stopping the motor for
the shift operation is reduced, and the load of the actuator for the
10 selection operation is reduced.
